Thalgott MIS-PL Retractor

Low Profile Retraction for Translaminar Fixation

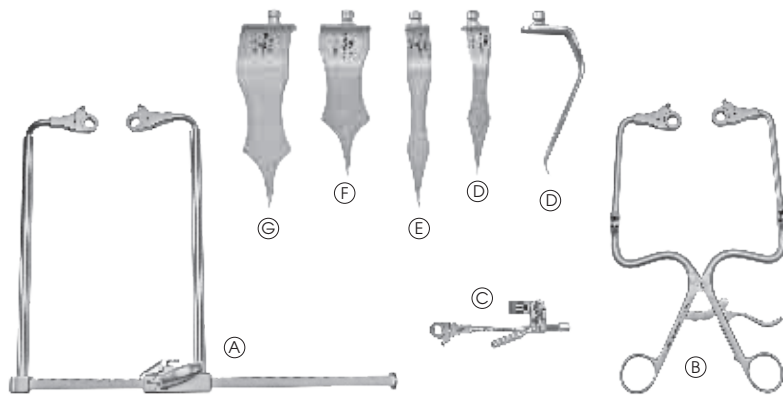

Successful translaminar fixation requires Uncompromised Exposure of the posterior elements of the lumbar spine for accurate translaminar screw placement. The access system developed by John S. Thalgott, M.D., is a minimally invasive system designed to accomplish superior visibility and access for treating segmental dysfunctions, spinal stenosis, and disc herniations. Translaminar screw fixation may provide additional segmental support in the event of anterior fusion, discectomy, and posterior decompression.

Far Left: The Thalgott MIS-PL Retractor System provides excellent, low profile multi level exposure

Left: Utilizing the Single Level Frame, single level exposure is easily accomplished and exceptional trajectory for translaminar screw insertion is created.

- Narrow blade tips provide clear access to the anatomy without interrupting screw trajectory
- Quick and easy ability to add independent retractors and handles for multi level procedures
 - Simple, hand held frame option for single level procedures
